Assignment- 1

Submited By :

Name - Aradhya Sharma

UID - 25MCC20042

Sub. Name - Frontend Technologies

Sub. Code - 25CAH-655

Section - 25MCC-101A

Submited To :

Name : Juned Alam

Designation: .....

Signature:

No.
Date: . .

Assignment

Que1 What is figma? Explain its Key features and why it is widely used in modern UI/UX design.

Ans Figma is a design tool used for UI and UX design. It allows teams to create, prototype and gather feedback on digital products.

- Key features:

- Multiple users can work on the same file simultaneously
- Since it runs on browser, files are stored on cloud.
- It enables users to create interactive prototypes
- Makes scalable adaptive designs easy to create.
- It allows developers to inspect designs.
- Supports flowchart, accessibility check, icons, illustrations and version support.

Que2 Differentiate between designing and prototype in figma. Explain with one real world UI example.

Ans

	Designing	Prototyping
i)	Creating the visual elements, layouts, and aesthetics of the interface.	i) Defining the logic, flow and interactivity
ii)	Handled in design tab	ii) Handled in prototype tab
iii)	Goal is to establish consistent design.	iii) Goal is to test user journey.

→ Real world UI Example : Music player

- Designing : Here, we crate main player screen, album art, play/skip buttons, artists, progress bar, lyrics, etc.

- Prototyping : Once design is ready, we connect play button to version of screen where it switches to pause, skip button to new screen of next song, etc.

Que 3 What are components and styles in figma? How do they help in maintaining consistency and saving time in large projects?

Ans. • Components : These are elements to be reused around entire project. When you turn an object into main component it acts as source. Any copy you make is called instance.

- Styles : These are saved properties that can be applied on an object. Instead of manually entering hex codes or font size each time, you define style for : colors, typography, Effects, etc.

→ How they maintain consistency and save time :

i) Global updates : you edit style for library and its updated for entire project.

ii) Reduced Human error : Ensures consistency across the project.

iii) Faster Onboarding : Significantly speeds up design process.

Que 4 Explain auto-layout in figma. How does it help in creating responsive web screens for different sizes?

Ans Auto layout: It is dynamic property you can add to frames and components that allows them to grow or shrink automatically.

→ How it helps in creating responsive designs

- Adaptive content: It eliminates the need to manually resize elements every time the content changes.
- Fluid Layouts: As the parent frame gets wider, internal elements expand proportionally.
- Automatic reordering: When you add, remove or hide an item within an auto layout frame, the other items instantly shift to fill gap or make room.

— Diagram :-

[Submit] : Button without auto layout

with autolayout: [Submit application]

padding, direction, alignment, etc., stay consistent. [Submit]

Que 5 Describe the complete developer handoff process in figma. How are designs shared, assets exported for developers?

Ans The developers in figma handoff is a streamlined workflow that bridges the gap between design and code,

primarily using dev mode. This ensures developers always see the most up-to-date versions of the design, eliminating confusion over outdated files.

→ How designs are shared, assets exported, code snippets generated

i) Impact and measure : Develops can see exact measurements of objects without moving anything.

ii) Code generation : when a developer clicks on layer, figma generates code snippet.

iii) Asset export : Designers can mark objects as export-able inside the design file.

iv) Version History : Developers can see the changes made since they last looked at the file.
